AB - NOVELTY :  
An anti-allergen fiber comprises a compound which inactivates allergens. Also claimed is a fiber product comprising the anti-allergen fiber.  
- USE :  
For making fiber products, such as carpet, tatami mat, bedding, mask, curtain and stuffed toys (claimed).  
- ADVANTAGE :  
The fiber effectively inactivates allergens.  
- INORGANIC CHEMISTRY :  
Preferred Compound: The compound which inactivates the allergen is zirconium salt.  
- EXAMPLE :  
A cloth or a non-woven fabric of cotton was immersed in an aqueous solution (specific gravity 1.65 at 25[deg]C) containing 35 weight percent (wt.%) of zirconium oxide and 46 wt.% of basic zirconyl chloride. The immersed fabric was air-dried and sewed into an anti-allergen sheet used as bedding cover. A standard dust containing 20-25 g/m<2> of mite allergen was dispersed on the non-woven fabric (6X6 cm) processed with 20 wt.% zirconium solution and air dried. A solution formed by dissolving 10 wt.% of benzyl alcohol and 30 wt.% of ethanol in 1-2 g of distilled water was sprayed on the dried fabric. The fabric was placed in a vinyl bag and mite allergen was extracted by adding a mixture containing 10 ml of phosphoric acid buffer and skimmed milk. The extract was centrifuged and the supernatant was extracted. The amount of allergens present in the extract was measured, by using enzyme immuno-assay (ELISA method). The results showed that the fabric was found to have 94.04% of inactivation effect.
